User → input email / password

Frontend → 發送 post login 把 intro 送到 server

backend → server.js (是整个 backend 的 entry，接收 request)

1. start the server

2. set middleware let server can read request body 「app.use(express.json());」

3. 把 request 分流到 routes 「app.use("/api/auth", require("./routes/authRoutes"));」

backend → route decide which function handle which request and call controller
匹配 URL　　叫 controller

backend → middleware (auth check)

backend → controller 檢查帳号 (the whole logic place)

1. 取得 request intro 「req.body
req.params
req.query」

2. call database User.findOne( )

backend → model 定義 data 長什麼樣 and provide database 操作 「User.findOne( )
User.create( )
User.updateOne( )」

MongoDB → store resource
