comprehensive understanding of the relationship between these three files

1. Routes → authRoutes.js

路由負責分派工作

router.get("/me", auth, ctrl.me);

這是在宣告「如果要執行 /me this function, request have to pass the guard first, finally get into ctrl.me

2. middleware → auth.js

中間件負責當 guard to check

The guard stopped the request to check for a "token", After decrypting the token, it found that ID and do a key point:

req.user = { id: decorded_id };

It help authcontroller.js to record and pasted the decrypted identity onto the request. let it can continue down this path with this identity.

3. controller → authController.js

控制器負責去倉庫領貨

It's looking the guard, let the person go and saw the request be passed by guard req.user.id

It's took id to find person on database, finally send your email to you.

It's final controller that responsible for packaging the data into JSON and sending it back.
