question: Assuming API is GET/api/auth/me return suddenly 401 unauthorized, but user already login.

The really problem might be in auth.js of middleware

Debugging step

1. confirm whether the request has a token.
2. confirm whether the middleware has received the token.
3. make sure the token can be decoded.
4. make sure that the JWT secret is consistent
5. make sure if the token has expired.

question: Assuming API is POST / api / auth / login

product requirements have changed

email login

↓

userName login

Solution: find database model first, make sure whether the userName in database model. If it's didn't exist that create it.

Thinking these things first:

data layer

logic layer

API layer

UI layer
